## Instructions for teacher

### Part one: knowledge worksheet

1. Introduction to the use of motion, force and energy to manipulate and control electromechanical and mechanical systems
2. Below are worksheets that require students to research specific fundamental motion, mechanisms and changes of force.

With teacher supervision and guidance, students can investigate given websites to find correct responses to the worksheet questions.

In addition, instruct students to research, using available research tools, and collect images of machines that represent the types of motion and mechanisms.

Students complete a series of investigation and presentation tasks to gain knowledge and understanding of the Engineering fundamental principles of the types of motion, and the mechanisms that direction and change movement.

Using the worksheets, students develop an understanding of:

- types of motion
- types of levers
- linkages
- pulleys and belts
- gears
- chain and sprocket
- crank and slider.

Students are required to seek definitions of terms, view associated mechanisms that exhibit these types of motion, and select appropriate images that relate to the methods of movement and motion.

This knowledge will be applied to designing and producing a mechanical device

## Part two: design and produce a mechanical device

Students will design, construct and test a simple mechanical device.

1. Provide or have students prepare a design folio; start with discussing and writing a design brief.
2. In the worksheet is a page for a mind map. Brainstorming or mind mapping are simple methods for the collection and sorting out of thoughts.

Instruct students to create their own mind map about simple mechanical devices, group them by types of motion, noting input actions and output results. Use computer software or pencil and paper.

3. Investigate the available input, transition and output components.

Design limitations

Input components, choose from:

- low voltage electric motors
- cranks
- springs
- rubber bands
- pneumatics

Processing or transition components, choice of:

- axles and shafts
- levers and linkages
- pulleys and belts
- gears
- sprockets and chains
- crank and sliders
- cams

Output components, choose from;

- wheels, various materials
- axles and shafts
- belts and tracks
- blades, fan or propellers or paddles
- low voltage DC generator

Power supply – batteries or low voltage power transformer

Technical knowledge and understanding of ratios of the input and output forces of components of devices

Materials for a stand or housing the device formed from;

- pieces of clear or coloured acrylic plastic
- light metals or timber
- other materials considered suitable for parts of the model

The housing may be painted, or decorated with signage or logos

Available specialist tools, materials and equipment

Teacher directed and demonstrated;

- identifying components parts, and construction/assembly of any electronic components
- general and specialist workshop tools such as plastics bandsaw, drill, buffing machine, heat strip bender

Methods of making a stand or housing

- marking, cutting and shaping, and finishing

4. Discuss with the class the types of mechanical devices that could be design-built.
5. Direct students in the writing of a statement of intent, based on the design problem.

6. Teach the applications of the fundamentals of the following:
  - motion – input, process or transition and output
  - ratios
  - safety awareness in the workshop.
7. Teach students some simple sketching techniques to get them to design, sketch and write notes on ideas and possible solutions:
  - sketches and notes should show a sequence of developing ideas and concepts
  - add measurements to the sketches
  - finish with a detailed sketch that could be used to build the solution
  - list of colours, additional materials and printed logos to add to the housing or stand
  - working drawings may be created, depending on the complexity of the solution.
8. Teacher should demonstrate some fundamental building skills:
  - students should observe, discuss and list the steps required to build the solution.
9. Students carefully follow their planned steps of production to collaboratively and safely use tools and equipment in the workshop to produce and test their solution.
10. Complete the assembly of the device to the housing or stand.
11. Students photograph their finished solution.
12. Evaluation: students write a 50 word reflection about how the device worked out and satisfied the design problem. Focus on the finished, working product. Explain how it works, and discuss its success as well as the areas that could be improved or changed (teacher may provide focus questions on a worksheet).

Name: \_\_\_\_\_

Group: \_\_\_\_\_

**Worksheet task description:**

Read, research and answer the questions on the following worksheets. Seek definitions of terms, view associated mechanisms that exhibit these types of motion, and select appropriate images that relate to the methods of movement and motion.

Types of Motion

All mechanisms involve **motion** of some kind.

Motion can be an input into a mechanism or an output from it. There are **four** types of motion.

|                      |                             |                      |                           |
|----------------------|-----------------------------|----------------------|---------------------------|
| <b>linear motion</b> | <b>reciprocating motion</b> | <b>rotary motion</b> | <b>oscillating motion</b> |
|----------------------|-----------------------------|----------------------|---------------------------|

- Place the four types of motion with the correct definition.
- Then find and include an image that represents that type of motion.

\_\_\_\_\_ is movement in a straight line in one direction.  
e.g. car on a freeway, aircraft flying through the sky.

\_\_\_\_\_ is movement forwards and backwards in a straight line.  
e.g. movement of a piston in a petrol engine or a sewing machine needle.

\_\_\_\_\_ is movement in a circle in one direction.  
e.g. CD spinning in a CD player or a tumble clothes dryer.

\_\_\_\_\_ is movement forwards and backwards in an arc.  
e.g. A child on a playground swing or a pendulum clock.

## Types of levers

Levers were probably the first kind of mechanism to be used; moving rocks or prising open shells. Many simple mechanisms used today are levers: crowbar, fork, wheelbarrow, bicycle brakes, tweezers, door handles and electrical switches.

**Find a definition of lever.**

---

---

---

What forms of motion do levers perform? \_\_\_\_\_

**Three** classifications of levers are determined by the arrangement of the effort, fulcrum and load.

Class 1: Load, Fulcrum and Effort

Class 2: Fulcrum, Load and Effort

Class 3: Fulcrum, Effort and Load

**For each type of lever, find two images that represent each type.**

Class 1: Load, Fulcrum and Effort

Class 2: Fulcrum, Load and Effort

Class 3: Fulcrum, Effort and Load

## Linkages

Linkages are levers coupled to transmit motion and force in a desired way.

- **Parallel linkages** move while the opposite sides stay parallel.
- **Treadle linkages** can change rotary motion into oscillating motion.
- **Toggle clamps** use an over-centre locking linkage to fix quickly and hold firmly.

Find two examples of:

**Parallel linkages**

**Treadle linkages**

**Toggle Clamps**

## Pulleys and Belts

Rotary motion produced by electric motors or engines must be controlled and, in most cases, the revolutions are transmitted through shafts or axles. These shafts can have pulleys attached.

Pairs of pulleys are grooved wheels linked by a belt.

The **driver pulley** is on the motor shaft and a **driven pulley** is on an output shaft.

Speed changes are made by using different sized pulleys.

**Stepped cone pulleys** are common on machinery that needs a quick change of output speeds. Belts connect and rotate with the different sized pulley wheels.

What forms of motion do pulleys and belts perform? \_\_\_\_\_

**Find examples of: stepped cone pulley sets, and different combinations of pulleys.**

## Gears

Gears are wheels with evenly spaced teeth cut into the circumference. Gear teeth are designed to interlock or mesh; the teeth need to be the same size and pitch. A gear train will transfer rotary motion to another gear; however, this will cause the driven gear to rotate in the opposite direction.

What forms of motion do gears perform? \_\_\_\_\_

**Find examples of spur gears, idler gear and compound gears.**

Other types of gears can be arranged to change the direction of rotation.

**Find examples of bevel gears, worm and wheel gears, crown and spur, rack and pinion.**

|  |  |
|--|--|
|  |  |
|  |  |

## Chain and Sprocket

A chain and sprocket mechanism has several advantages over pulley systems; there is no possibility of slippage, while the distance between driver and driven can be greater.

The sprockets are toothed wheels. The chain, usually made up from multiple links and pins, runs over the teeth.

What forms of motion do chain and sprocket perform? \_\_\_\_\_

**Find examples of chain and sprocket assemblies.**

## Crank and Slider

The crankshaft and slider (e.g. in a car engine, connecting rod attached to the piston in the cylinder) mechanism is designed to change reciprocating motion into rotary motion. However, the mechanism can be used where powered rotary motion can be changed into reciprocating motion. Older forms of a crank can be found in other simpler mechanisms.

**Find examples of crank and slider mechanisms**

All mechanisms are designed to create some type of mechanical advantage. This mechanical advantage (MA) is usually calculated by the ratio between the input force and the resultant output force through the components of the mechanical device.

Simple calculations can use the following formulas to find the difference between the original speed (input) and the final speed (output). Note: the symbol  $\varnothing$  is diameter, and  $n^\circ$  is the number of.

- pulley belt ratio =  $\frac{\varnothing \text{ follower pulley}}{\varnothing \text{ driver pulley}}$  = input revolutions:1 output revolution
- chain and sprocket ratio =  $\frac{n^\circ \text{ teeth follower gear}}{n^\circ \text{ teeth driver gear}}$  = input revolutions:1 output revolution
- gear ratio =  $\frac{n^\circ \text{ teeth follower gear}}{n^\circ \text{ teeth driver gear}}$  = input revolutions:1 output revolution
  - pinion gear
  - idler gear
- for rack and pinion, calculate the distance moved =  $\frac{n^\circ \text{ teeth pinion} \times n^\circ \text{ revolutions}}{n^\circ \text{ teeth per metre of rack}}$

Student worksheet for design process

Name: \_\_\_\_\_

Group: \_\_\_\_\_

**Design Brief:**

In this section, write down your design problem.

---

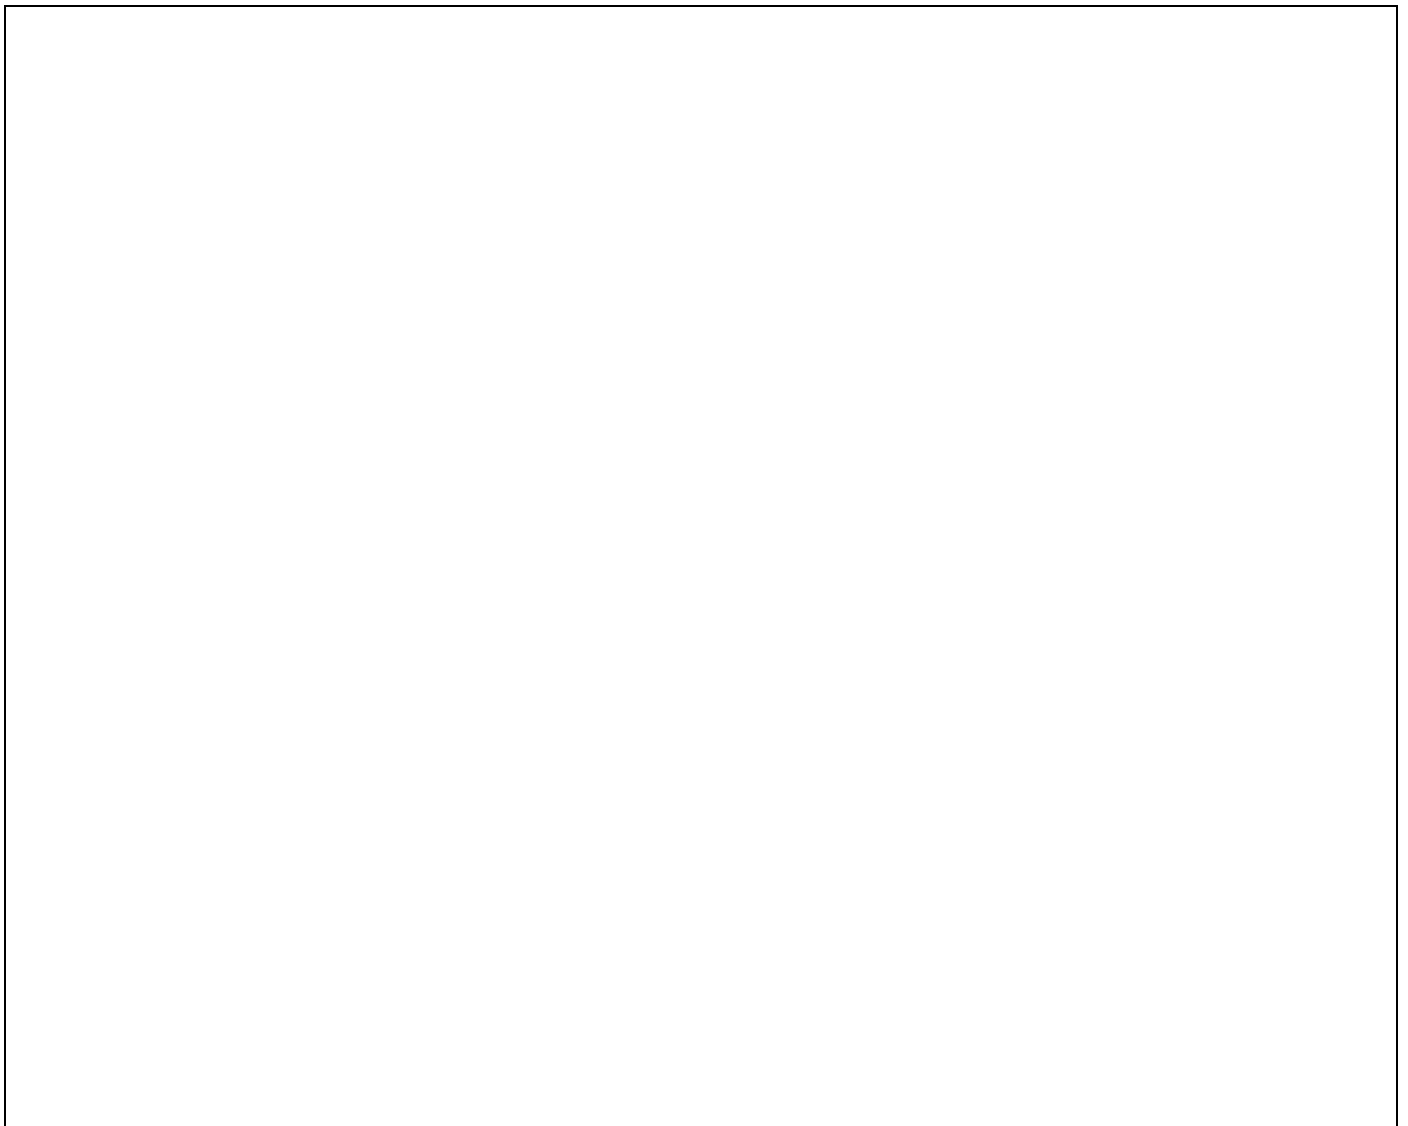

---

---

---

Create a mind map showing simple mechanical devices. Group them by types of motion, noting input actions and output results. You may use computer software or pencil and paper.

**Mind Mapping**

**Statement of intent**

Write a clear description of the project you are going to design and make.

Write and describe each of the following:

- why – situation
- what – is it expected to do
- where – location
- who – you, family or other
- and when – time of day, or occasion.

Make statements that are clear, with full sentences, and that are detailed in their meaning.

Include the likely components you think are needed for this device to function.

---

---

---

---

---

---

---

---

---

---

Think about ideas and sketch some concepts **drawing space for ideas and concepts**

**Additional notes on ideas, colours and logos for device**

---

---

**Drawing template for ideas and concepts**

**Write notes around and about your ideas (annotations)**

**Notes from Teacher Production skills demonstration**

Take notes on materials, components, cutting and shaping tools and machines, assembly of components, and finishing procedures, testing, forces and powering up.

- \_\_\_\_\_

**Planning production**

List the tools and equipment, and the steps of the process you need to follow to produce your design.

| Tools/equipment | Process |
|-----------------|---------|
|                 |         |
|                 |         |
|                 |         |
|                 |         |
|                 |         |
|                 |         |
|                 |         |
|                 |         |
|                 |         |
|                 |         |

**My completed working device (photographs) and evaluation**

Evaluation: Write a 50 word reflection about how you think your device worked out. Focus on the finished, working product. Explain how it works, and discuss its success as well as the areas that could be improved or changed.

---

---

---

---

---

---

---

---

---

---

*Trigger questions*

- *Did your design satisfy the design brief and statement of intent? If not, what changes did you make and why?*
- *Did your design turn out as you planned it would? Explain why or why not? (Consider your sketch and comment on the size, shape, colour, added materials etc.)*

- *Did your design work mechanically as planned? Explain why or why not?*
- *Did your production process use the tools and equipment listed? If not, what changes did you make and why?*
