Science Understanding

BIOLOGICAL SCIENCES

Cells are the basic unit of living things; they have specialised structures and functions. [\(ACSSU149\)](#)

Multi-cellular organisms contain systems of organs carrying out specialised functions that enable them to survive and reproduce. [\(ACSSU150\)](#)

CHEMICAL SCIENCES

Properties of the different states of matter can be explained in terms of the motion and arrangement of particles. [\(ACSSU151\)](#)

Differences between elements, compounds and mixtures can be described at a particulate level ([ACSSU152](#))

Chemical change involves substances reacting to form new substances ([ACSSU](#))

EARTH AND SPACE SCIENCES

Sedimentary, igneous and metamorphic rocks contain minerals and are formed by processes that occur within Earth over a variety of timescales ([ACSSU](#))

PHYSICAL SCIENCES

Energy appears in different forms, including movement (kinetic energy), heat and potential energy, and energy transformation and transfers cause change within systems

Year 8 Achievement

Science Understand

At Standard, students use a scientific model to explain an event or process. They identify different types of transformations and processes of rock formation. They describe the function of a cell, organ, or system.

Science as a Human Endeavour

Students explain how a scientific idea or theory was developed and where science is applied.

Science Inquiry Skills

Students construct a scientific model, safety and ethics with experimental methods controlled. They compare patterns and trends to explain how modifications apply their scientific findings using appropriate language and findings.

The science inquiry skills and science as a human endeavour strands in the science curriculum for schools and teachers refer to the expectations outlined in the curriculum framework for science. The understanding strand for the relevant year level to ensure that the three strands of the curriculum are interrelated and their content descriptions are organised into teaching and learning activities.

Incorporating the key ideas of science

Over Years 7 to 10, students develop their understanding of matter and energy. Their scales are shaped by flows of energy and matter and interactions between them. They understand relative amounts.

In Year 8, students are introduced to cells as microscopic structures. They link form and function at a cellular level and explore the organisation of interdependent organs. Similarly, they explore changes in matter and energy. They begin to classify different forms of energy and understand physical change. They begin to classify different forms of energy including the role of heat and kinetic energy in the rock cycle. They identify components in systems and explain these relationships through diagrams and propose explanations, drawing on evidence to support their claims.
