

# Australian Curriculum: Science

## Achievement Standards (F-10)

- Achievement standards are designed to provide a holistic statement of the level of student achievement at the end of each year of schooling.
- This representation enables teachers to identify differences in the achievement standards through the phases of schooling.

Australian Curriculum: Science Achievement Standards (Foundation – Year 7)								
Year	F	1	2	3	4	5	6	7
<b>Understandings</b>  <i>Chemical sciences</i>  <i>Physical sciences</i>  <i>Earth and Space sciences</i>  <i>Biological sciences</i>  <i>Science as a human Endeavour</i>	Students describe the <b>properties</b> and behaviour of familiar objects.  They suggest how the <b>environment</b> affects them and other living things....	Students describe objects and events that they encounter in their everyday lives, and the effects of interacting with <b>materials</b> and objects.  They describe changes to things in their <b>local environment</b> ...  They identify a range of habitats.  ....and suggest how science helps people care for environments.	They identify that certain <b>materials</b> and resources have different uses  Students describe changes to objects, <b>materials</b> and living things.  and describe examples of where science is used in people's daily lives.	Students use their understanding of the movement of the Earth, <b>materials</b> and the behaviour of heat to suggest explanations for everyday observations.  They describe features common to living things.  They describe how they can use science <b>investigations</b> to respond to questions and identify where people use science knowledge in their lives.	Students apply the <b>observable properties</b> of <b>materials</b> to explain how objects and <b>materials</b> can be used.  They use contact and non-contact <b>forces</b> to describe interactions between objects.  They discuss how natural and human processes cause changes to the Earth's surface.  They describe <b>relationships</b> that assist the survival of living things and sequence key stages in the life cycle of a plant or animal.  They identify when science is used to ask questions and make predictions. They describe situations where science understanding can influence their own and others' actions.	Students <b>classify</b> substances according to their <b>observable properties</b> and behaviours.  They explain everyday phenomena associated with the transfer of light.  They describe the key features of our solar <b>system</b> .  They <b>analyse</b> how the form of living things enables them to function in their environments.  Students discuss how scientific developments have affected people's lives and how science knowledge develops from many people's contributions.	Students compare and <b>classify</b> different types of <b>observable</b> changes to <b>materials</b> .  They <b>analyse</b> requirements for the transfer of electricity and describe how energy can be transformed from one form to another to generate electricity.  They explain how natural events cause rapid change to the Earth's surface.  They describe and predict the effect of environmental changes on individual living things.  Students explain how scientific knowledge is used in decision making and identify contributions to the development of science by people from a range of cultures.	Students describe techniques to separate pure substances from mixtures.  They represent and predict the effects of unbalanced <b>forces</b> , including Earth's gravity, on motion  They explain how the relative positions of the Earth, sun and moon affect phenomena on Earth They <b>analyse</b> how the <b>sustainable</b> use of resources depends on the way they are formed and cycle through Earth <b>systems</b> .  They predict the effect of environmental changes on feeding <b>relationships</b> and <b>classify</b> and organise diverse organisms based on <b>observable</b> differences.  Students describe situations where scientific knowledge from different science disciplines has been used to solve a real-world problem. They explain how the solution was viewed by, and impacted on, different groups in society.
<b>Skills</b>  <i>Questioning and predicting</i>  <i>Planning and conducting</i>  <i>Processing and analysing data and information</i>  <i>Evaluating</i>  <i>Communicating</i>	Students share observations of familiar objects and events.	Students make predictions, and investigate everyday phenomena.  They follow instructions to record and sort their observations and share their observations with others.	Students pose questions about their experiences and predict outcomes of <b>investigations</b> .  They use informal measurements to make and compare observations  They follow instructions to record and represent their observations and communicate their ideas to others.	Students use their experiences to pose questions and predict the outcomes of <b>investigations</b> .  They make formal measurements and follow procedures to collect and present observations in a way that helps to answer the <b>investigation</b> questions.  Students suggest possible reasons for their findings  They describe how safety and fairness were considered in their investigations.  They use diagrams and other representations to communicate their ideas	Students follow instructions to identify investigable questions about familiar contexts and predict likely outcomes from <b>investigations</b> .  They discuss ways to conduct <b>investigations</b> and safely use equipment to make and record observations.  They use provided <b>tables</b> and simple column <b>graphs</b> to organise their <b>data</b> and identify <b>patterns</b> in <b>data</b> .  Students suggest explanations for observations and compare their findings with their predictions.  They suggest reasons why their methods were fair or not.  They complete simple <b>reports</b> to communicate their methods and findings.	Students follow instructions to pose questions for <b>investigation</b> , predict what might happen when <b>variables</b> are changed, and plan <b>investigation</b> methods.  They use equipment in ways that are safe and improve the accuracy of their observations.  Students construct <b>tables</b> and <b>graphs</b> to organise <b>data</b> and identify <b>patterns</b> .  They use <b>patterns</b> in their <b>data</b> to suggest explanations and refer to <b>data</b> when they <b>report</b> findings.  They describe ways to improve the fairness of their methods and communicate their ideas, methods and findings using a range of text types.	Students follow procedures to develop investigable questions and <b>design investigations</b> into simple cause-and-effect <b>relationships</b> .  They identify <b>variables</b> to be changed and measured and describe potential safety risks when planning methods.  They collect, organise and interpret their <b>data</b> , identifying where improvements to their methods or <b>research</b> could improve the <b>data</b> .  They describe and <b>analyse relationships</b> in <b>data</b> using graphic representations and construct <b>multi-modal texts</b> to communicate ideas, methods and findings.	Students identify questions that can be investigated scientifically.  They plan fair experimental methods, identifying <b>variables</b> to be changed and measured.  They select equipment that improves fairness and accuracy and describe how they considered safety.  Students draw on <b>evidence</b> to support their <b>conclusions</b> .  They summarise <b>data</b> from different sources, describe <b>trends</b> and refer to the quality of their <b>data</b> when suggesting improvements to their methods.  They communicate their ideas, methods and findings using <b>scientific language</b> and appropriate representations.

Australian Curriculum: Science		Achievement Standards (Year 7 – 10)		
Year	7	8	9	10
<b>Understandings</b>				
<i>Chemical sciences</i>	students describe techniques to separate pure substances from mixtures.	students compare physical and chemical changes and use the particle <b>model</b> to explain and predict the <b>properties</b> and behaviours of substances.	students explain chemical processes and natural radioactivity in terms of atoms and energy transfers and describe examples of important chemical reactions.	students <b>analyse</b> how the periodic <b>table</b> organises elements and use it to make predictions about the <b>properties</b> of elements. They explain how chemical reactions are used to produce particular products and how different factors influence the rate of reactions.
<i>Physical sciences</i>	They represent and predict the effects of unbalanced <b>forces</b> , including Earth's gravity, on motion.	They identify different forms of energy and describe how energy transfers and transformations cause change in simple <b>systems</b> .	They describe <b>models</b> of energy transfer and apply these to explain phenomena.	They explain the concept of energy conservation and represent energy transfer and transformation within <b>systems</b> . They apply <b>relationships</b> between <b>force</b> , mass and acceleration to predict changes in the motion of objects.
<i>Earth and Space sciences</i>	They explain how the relative positions of the Earth, sun and moon affect phenomena on Earth. They <b>analyse</b> how the <b>sustainable</b> use of resources depends on the way they are formed and cycle through Earth <b>systems</b> .	They compare processes of rock formation, including the time scales involved.	They explain global features and events in terms of geological processes and timescales.	Students describe and <b>analyse</b> interactions and cycles within and between Earth's spheres. They <b>evaluate</b> the <b>evidence</b> for scientific <b>theories</b> that explain the origin of the universe and the diversity of life on Earth.
<i>Biological sciences</i>	They predict the effect of environmental changes on feeding <b>relationships</b> and <b>classify</b> and organise diverse organisms based on <b>observable</b> differences.	They <b>analyse</b> the <b>relationship</b> between structure and function at cell, organ and body <b>system</b> levels. Students examine the different science knowledge used in occupations.	They <b>analyse</b> how biological <b>systems</b> function and respond to external changes with reference to interdependencies, energy transfers and flows of <b>matter</b> .	They explain the processes that underpin heredity and evolution.
<i>Science as a human Endeavour</i>	Students describe situations where scientific knowledge from different science disciplines has been used to solve a real-world problem. They explain how the solution was viewed by, and impacted on, different groups in society.	They explain how <b>evidence</b> has led to an improved understanding of a scientific idea and describe situations in which <b>scientists</b> collaborated to generate solutions to contemporary problems.	They describe social and technological factors that have influenced scientific developments and predict how future applications of science and <b>technology</b> may affect people's lives.	Students <b>analyse</b> how the <b>models</b> and <b>theories</b> they use have developed over time and discuss the factors that prompted their review.
<b>Skills</b>				
<i>Questioning and predicting</i>	Students identify questions that can be investigated scientifically.	Students identify and construct questions and problems that they can investigate scientifically.	Students <b>design</b> questions that can be investigated using a range of inquiry skills.	Students develop questions and <b>hypotheses</b> and independently <b>design</b> and improve appropriate methods of <b>investigation</b> , including <b>field work</b> and laboratory experimentation.
<i>Planning and conducting</i>	They plan fair experimental methods, identifying <b>variables</b> to be changed and measured.	They consider safety and ethics when planning <b>investigations</b> , including <b>designing</b> field or experimental methods.	They <b>design</b> methods that include the control and accurate measurement of <b>variables</b> and systematic collection of <b>data</b> and describe how they considered ethics and safety.	They explain how they have considered reliability, safety, fairness and ethical actions in their methods and identify where <b>digital technologies</b> can be used to enhance the quality of <b>data</b> .
<i>Processing and analysing data and information</i>	They select equipment that improves fairness and accuracy and describe how they considered safety.	They identify <b>variables</b> to be changed, measured and controlled.	They <b>analyse trends</b> in <b>data</b> , identify <b>relationships</b> between <b>variables</b> and reveal inconsistencies in results.	When <b>analysing data</b> , selecting <b>evidence</b> and developing and justifying <b>conclusions</b> , they identify alternative explanations for findings and explain any sources of uncertainty.
	Students draw on <b>evidence</b> to support their <b>conclusions</b> .	Students construct representations of their <b>data</b> to reveal and <b>analyse patterns</b> and <b>trends</b> , and use these when justifying their <b>conclusions</b> .	They <b>analyse</b> their methods and the quality of their <b>data</b> , and explain specific actions to improve the quality of their <b>evidence</b> .	Students <b>evaluate</b> the <b>validity</b> and reliability of claims made in <b>secondary sources</b> with reference to currently held scientific views, the quality of the methodology and the <b>evidence</b> cited.
<i>Evaluating</i>	They summarise <b>data</b> from different sources, describe <b>trends</b> and refer to the quality of their <b>data</b> when suggesting improvements to their methods.	They explain how modifications to methods could improve the quality of their <b>data</b> and apply their own scientific knowledge and <b>investigation</b> findings to <b>evaluate</b> claims made by others.	They <b>evaluate</b> others' methods and explanations from a scientific perspective and use appropriate language and representations when communicating their findings and ideas to specific audiences.	They construct <b>evidence</b> -based arguments and select appropriate representations and text types to communicate science ideas for specific purposes.
<i>Communicating</i>	They communicate their ideas, methods and findings using scientific language and appropriate representations.	They use appropriate language and representations to communicate science ideas, methods and findings in a range of text types.
